

AI Compass — Guided pilot

One automated task, taken all the way into service — with the proof that it works.

Atmart LLC

Advisory for companies
and NGOs
atmart.ltd

By the end, the automation **actually runs** in your organisation and your team operates it **without us**. You own the test set that proves its quality, the audit trail that shows what it did, and its exact cost per task.

WHO IT IS FOR

Organisations that completed a **Diagnostic** and want to start with the highest-value task · those who already know which task is draining them and want a solution that holds · those who tried an AI tool and dropped it for lack of control and method.

HOW IT WORKS

- 1 Week 0 — Choice and criteria**
We pick the task and write the success criteria together BEFORE building: expected quality, target time, cost ceiling.
- 2 Week 1 — Control and tests**
We design the human control (who validates what, and when) and build the test set from your real cases, including the awkward ones.
- 3 Weeks 2 to 4 — Build**
Gradual roll-out: first alongside your current method, then replacing it once the tests pass.
- 4 Week 5 — Measurement**
Quality measured by the tests, time actually saved, observed cost per task. Numbers, not impressions.
- 5 Week 6 — Handover**
Training for your team, a troubleshooting guide, and a 30-day review to confirm it holds without us.

WHAT IS NOT INCLUDED

Rebuilding your existing software, licence purchases, data migration, and any guarantee of quantified gains before the week-5 measurement. A second use case means another pilot or an **Ongoing support** agreement.

WHAT YOU RECEIVE

The automation in service

Running on your real scope, not on a demo.

The test set

Your real cases with the expected answer: measure quality today and again in six months.

The audit trail

A readable log: what the tool did, with which data, and who approved it.

The cost model

Cost per task and per month, spending cap, break-even threshold.

The troubleshooting guide

What to do when the tool is wrong, breaks down or costs too much — written for your team.

Training and a 30-day review

Your team self-sufficient, then a check one month later.

from \$5,000

firm quote after scoping

4 to 6 weeks. The price depends on the complexity of the task and the number of people involved — it is agreed in writing before we start.

Two conditions for success: an available point of contact on your side (2 to 3 hours a week) and access to the necessary data. We run at most 2 pilots in parallel.

WHY ATMART

Proof, not a demo

Tests, audit trail and known cost: three things a demo never gives you.

Human control first

We design who validates what before writing a single automation.

Your teams, their language

Training and documents in English, Haitian Creole, French or Spanish.

Next step: choosing the task

If you already have a Diagnostic, we start from your roadmap. If not, a 30-minute conversation is enough to tell whether a task is a good candidate — and to say plainly if it is not.

Atmart LLC — advisory on the use of artificial intelligence. The pilot is a design and deployment service: gains are measured, never guaranteed in advance. The automation relies on third-party AI services whose prices and rules may change; a manual fallback is always documented. A confidentiality agreement is signed before any access to data. Non-contractual document — the final proposal is issued after scoping.
